

INTEGRATED DEVELOPMENT

Collaborating across sectors can transform health for women, children and families.

Access to Health Care

Under-5 child mortality is more than **50% higher at a travel distance of 4 hours** compared with having a health facility in the village.¹

Access to a health care facility can reduce newborn deaths by 43%² and maternal deaths by 74%.³

Nutrition

Malnutrition is the underlying factor in about **45% of all child deaths**, contributing to **3.5 million deaths** each year.⁴

Under-nutrition reduces an individual's earning potential.⁵

Improved breastfeeding practices could **save the lives of 1.5 million children under 5** annually.⁶

Improved nutrition during the first 1,000 days of a newborn's life can **reduce the risk of developing various chronic conditions**.⁷

Water, Sanitation and Hygiene (WASH)

663 million people do not have access to safe drinking water sources.⁸

2.4 billion people lack improved sanitation.⁹

Nearly **2000 children die each day** from diarrhea caused by unsafe water and poor sanitation.¹⁰

Safe WASH practices can... prevent at least **860,000 child deaths** a year.¹¹

Education

Providing girls with an education helps break the cycle of poverty

Educated women are...

- less likely to marry early and against their will
- less likely to die in childbirth
- more likely to have healthy babies
- more likely to send their children to school¹³

One extra year of schooling could... increase an individual's earnings **10-20%**.¹⁴

Energy

Nearly **1.3 billion** people lack access to electricity worldwide, with residents of **10 developing countries** accounting for **two-thirds** of those without access.¹⁵

Lack of electricity is a huge barrier to overcoming poverty.

Without electricity, the possibility of other critical services such as education and health care decline.

ADDRESSING THESE SOCIAL DETERMINANTS FOR HEALTH IS KEY TO ACHIEVING THE
